IMPORTANT NOTICE REGARDING CONTENTS OF THIS REPORT

Please Read Carefully

The design, engineering, and other information contained in this document is furnished for the purpose of obtaining the applicable Nuclear Regulatory Authority review and determination of acceptability for use for the BWRX-300 design and licensing basis information contained herein. The only undertakings of GEH with respect to information in this document are contained in the contracts between GEH and its customers or participating utilities, and nothing contained in this document shall be construed as changing those contracts. The use of this information by anyone for any purpose other than that for which it is intended is not authorized; and with respect to any unauthorized use, no representation or warranty is provided, nor any assumption of liability is to be inferred as to the completeness, accuracy, or usefulness of the information contained in this document. Furnishing this document does not convey any license, express or implied, to use any patented invention or any proprietary information of GEH, its customers or other third parties disclosed herein or any right to publish the document without prior written permission of GEH, its customers or other third parties.

UK SENSITIVE NUCLEAR INFORMATION AND US EXPORT CONTROL INFORMATION

This document does not contain any UK Sensitive Nuclear Information (SNI) subject to protection from public disclosure as described in the Nuclear Industries Security Regulations (NISR) 2003, does not contain UK Export Controlled Information (ECI), and does not contain US Export Controlled Information (ECI) subject to the export control laws and regulations of the United States, including 10 CFR Part 810.

NEDO-34219 Revision A

EXECUTIVE SUMMARY

This chapter of the Preliminary Environmental Report presents a generic site description for the United Kingdom BWRX-300 Small Modular Reactor. The BWRX-300 is the tenth evolution of the Boiling Water Reactor (BWR) design and represents an evolution of both the Economic Simplified BWR and the Advanced BWR.

The chapter supports the overall claim that “The BWRX-300 is capable of being constructed, operated and decommissioned in accordance with the standards of environmental, safety, security and safeguard protection required in the UK”, and provides information to support the environmental Level 1 claim that “The design of the BWRX-300 Small Modular Reactor has been optimised to reduce environmental impacts to As Low As Reasonably Achievable (ALARA) throughout the whole lifecycle (construction, commissioning, operation and decommissioning).”

With regards to the generic site description, the chapter provides more detailed information in support of the additional environmental Level 2 claim that the “BWRX-300 has been designed and can be operated to minimise the impact of radioactive discharges on members of the public and the environment.”

This chapter describes the current regulatory context for considerations that should be made within the description of the generic site for a new nuclear power station. Furthermore, alignment to Environment Agency methodology is introduced which defines the selection of parameters relevant to prospective radiological assessments.

This chapter forms part of an integrated demonstration in support of the above claims and as such provides support to Preliminary Environmental Report Chapter E9 – Prospective Radiological Assessment and Chapter E10 – Other Environmental Regulations. The chapter also interfaces with the Volume 2 Preliminary Safety Report Chapters 2 – Site Characteristics and Chapter 20 – Environmental Aspects.

SYMBOLS AND DEFINITIONS

Symbol	Definition
Bq/y	Becquerel per year
$\mu\text{Gy/h}$	Micro Gray per hour
h/y	Hours per year
Kg/y	Kilograms per year
m	Metres (SI unit)
m^3	Metres cubed
m^3/h	Metres cubed per hour
m/s	Metres per second
m^2/y	Metres squared per year
m^3/y	Metres cubed per year
Per s	Per second
$\mu\text{Sv/y}$	Micro Sieverts per year
t/m^3	Tonnes per metre cubed
$\text{t}/\text{m}^2/\text{y}$	Tonnes per metre squared, per year

Term	Definition
Gray	One Gray is equal to the adsorption of one joule of radiation energy per kilogram of matter
Sievert	SI unit of radiation adsorption

NEDO-34219 Revision A

2. GENERIC SITE DESCRIPTION

2.1 Introduction

The GE Hitachi Nuclear Energy Americas, LLC (GEH) BWRX-300 is a Boiling Water Reactor (BWR) that has been designed as a Small Modular Reactor (SMR). As the tenth generation of the BWR design, the BWRX-300 incorporates the lessons learned from worldwide programs and operational experience of GEH BWRs, inclusive of the Economic Simplified Boiling Water Reactor (ESBWR) and Advanced Boiling Water Reactor (ABWR).

GEH are a requesting party presenting an Environmental Case submission to the United Kingdom (UK) regulators for Generic Design Assessment (GDA) at the Step 2 level for the BWRX-300. This chapter sits within the Preliminary Environmental Report (PER) which comprises the suite of documents that make up the safety case.

This chapter provides a description of a generic site for the UK BWRX-300 as part of the requirements of the GDA process outlined in the Environment Agency's (EAs) "Process and Information Document for Generic Assessment of Candidate Nuclear Power Plant Designs," (Reference 2-1). In conjunction with the Preliminary Safety Report (PSR) Chapter 2: Site Characteristics, this chapter supports prospective radiological assessments required by the Environmental Permitting (England and Wales) Regulations (EPR) 2016 as part of the regulatory process described in this Section 2.1.

The Generic Site Description (GSD) for the UK BWRX-300 does not represent any particular location in the UK but considers the envelope of characteristics of potential UK site conditions. At this stage of the GSD, a representative coastal site has been chosen, noting that as future site-specific decisions are made, other site options are available and can be considered for an individual BWRX-300 site. This chapter provides specific information concerning the following parameters that have been considered within radiological assessments:

- Geographical information
- Marine data
- Meteorological data
- Human and non-human receptors
- Locations of sites of special scientific interest, areas of outstanding natural beauty and areas of significance to cultural heritage

There is currently no specific site proposed for the development and operation of a UK BWRX-300. However, the radiological assessment of the generic site description presented here has utilised the opportunity to consider a single generic site based on multiple candidate sites within the site envelope.

The GSD describes the set of environmental characteristics which define the envelope within which radiological assessments have been carried out within NEDC-34226P, "BWRX-300 UK GDA Preliminary Environmental Report Chapter E9 – Prospective Radiological Assessment," (Reference 2-2).

Additional site characteristics and their future evaluation in support for the design, safety assessment and periodic safety review and can be found in NEDC-34164P, "BWRX-300 Preliminary Safety Report Chapter 2 – Site Characteristics," (Reference 2-3).

NEDO-34219 Revision A

Scope

This report presents the current status of the GSD for the deployment of a BWRX-300 in the UK. Whilst specific characteristics will form a future development stage of the BWRX-300, the scope of the Step 2 submission will include:

- A description of the generic site characteristics that envelope suitable sites for new nuclear power plants in the UK
- Descriptions of environmental characteristics and constraints of the generic site(s) that the requesting party will use to provide its dose assessment

Purpose

The purpose of this chapter is to provide the envelope of characteristics used to support the radiological assessment provided in PER Chapter E9 (Reference 2-2).

Claims, Arguments and Evidence

At this stage, the BWRX-300 is presented as a generic design, capable of deployment anywhere in the world. To integrate into the UK context and align with regulatory expectations, some design aspects will form part of a future development stage, likely involving input from the UK developer/operator of the BWRX-300. More detailed consideration, justification and substantiation of these elements will therefore be made at the site-specific development stage.

This document provides information in support of the following environmental Level 2 claim:

- “The BWRX-300 has been designed and can be operated to minimise the impact of radioactive discharges on members of the public and the environment.”

Document Route Map

The document interfaces with the following PER chapters:

- Chapter E9 – NEDC-34226P, (Reference 2-2)
- Chapter E10 – NEDC-34227P, “BWRX-300 UK GDA Preliminary Environmental Report Chapter E10: Other Environment Regulations,” (Reference 2-4)

The document interfaces with the following Volume 2 PSR chapters:

- Chapter 2 – NEDC-34164P, (Reference 2-3)
- Chapter 20 – NEDC-34192P, “BWRX-300 UK GDA Preliminary Safety Report, Chapter 20: Environmental Aspects,” (Reference 2-5)

NEDO-34219 Revision A

2.2 Regulatory Context

For environmental discharges of radioactivity to take place in England and Wales, an application must be approved under “The Environmental Permitting (England and Wales) Regulations 2016,” (Reference 2-6). “UK Strategy for Radioactive Discharges: 2018 Review of the 2009 Strategy,” (Reference 2-7) does not set out individual limits for radioactive discharges and instead dose limits are derived from international recommendations from the International Commission on Radiological Protection (ICRP) (Reference 2-8) and International Atomic Energy Agency (IAEA), “Radiation Protection and Safety of Radiation Sources: International Basic Safety Standards, GSR Part 3,” (Reference 2-9). Limits are therefore specified and regulated in accordance with Schedule 23 Part 4 of the EPR 2016 (Reference 2-6):

Schedule 23 Part 4 1(b) (Reference 2-6) - the sum of the doses resulting from the exposure of any member of the public to ionising radiation does not exceed the dose limits set out in Article 12 of the Basic Safety Standards Directive subject to the exclusions set out in Article 5(c) of that Directive.

Part 4 2(1) In exercising those relevant functions in relation to the planning stage of radiation protection, the regulator must have regard to the following maximum doses to individuals which may result from a defined source:

- *0.3 millisieverts per year from any source or*
- *0.5 millisieverts per year from the discharges from any single site*

The Environment Agency (EA) outlines the environmental issues that an operator of a nuclear power station should consider in site selection in their RSR guidance for site evaluation (Reference 2-10) which are underpinned by five generic Site Evaluation Developed Principles (SEDPs). These principles are deemed to be relevant to both generic and specific sites proposed for new nuclear facilities, such as the UK BWRX-300, the five principles are:

- *SEDP1 – When evaluating sites for a new facility, account should be taken of the factors that might affect the protection of people and the environment from radiological hazards and the generation of radioactive waste.*
- *SEDP2 – Data should be provided to allow the assessment of rates and patterns of migration of radioactive materials in the air and the aquatic and terrestrial environments around sites.*
- *SEDP3 – Levels of ambient radioactivity around the sites of new facilities should be assessed.*
- *SEDP4 – In the case of nuclear and other sites on which there are already one or more facilities, the radiological impact of the whole site on people and the environment should be assessed when considering the suitability of the site for any new facility.*
- *SEDP5 – The characteristics of the site and its surrounding area should be kept under review and assessments made of the effects of natural and man-made changes.*

Of the principles described above, SEDP1 and SEDP2 are considered relevant to the Step 2 GDA submission. Within this chapter, the considerations outlined in SEDP1 form the basis for the description of the generic site (Reference 2-10) alongside additional characterisation provided within PSR Chapter 2. The regulatory expectation is that the following factors are taken into account within assessments:

- *Locations and habits of people, especially those likely to be most exposed as a result of releases of radionuclides into the environment from the facility (potential critical groups)*

NEDO-34219 Revision A

- *Locations where terrestrial, freshwater and marine foodstuffs are produced and obtained*
- *Locations of surface and underground water supplies used by people and animals and the vulnerability of those water supplies*
- *Potential effects of coastal erosion and sea level rise*
- *Presence of radioactively contaminated land or groundwater*
- *Locations of land and water bodies used for recreational and amenity purposes*
- *Locations of sites of special scientific interest, areas of outstanding natural beauty and areas of significance to cultural heritage*

SEDP2 outlines the data requirements (Reference 2-10) for the applicants to carry out prospective dose assessments. These data requirements are presented across differing environmental media, namely air; marine, surface freshwater bodies; soils and rock. In addition, the principle requires concentration factors or transfer parameters to be considered for movement through food chains and for the concentration of radionuclides in non-human species.

These environmental media and considerations subsequently feed into the RSR generic developed principles for the radiological protection of people and environment. Specifically, Radiological Protection Developed Principle (RPDP)4 which requires the applicant of a permit to carry out prospective dose assessments to include within their application, "RSR: Radiological Protection of People and the Environment: Generic Developed Principles," (Reference 2-11).

Presently, it is expected that GEH will exit the GDA process at the end of Step 2. However, for subsequent future development and progression to site specific designs, it would be expected that review of the site would take place to satisfy the requirements of SEDP5.

NEDO-34219 Revision A

2.3 Methodology

The initial radiological assessment methodology provides a system for carrying out simple and cautious prospective assessment of doses arising from discharges to the environment. It is published by the EA to support permit applications. The Initial Radiological Assessment Tool v2 (IRAT2) (References 2-12 and 2-13) is intended to enable a simple and robust method of calculation of the radiological consequences associated with normal operation discharges. The selection and suitability of the IRAT2 tool is outlined in Chapter E9 (Reference 2-2).

The IRAT2 methodology that has been used to support GEH's Step 2 GDA submission is based upon a staged approach which is described in detail in Chapter E9 (Reference 2-2). In the case of both Stage 1 and 2, generic datasets have been used. It is anticipated that for a future development stage, site-specific data will be used to supplement the generic data.

At Stage 1, the reference dose thresholds are 20 $\mu\text{Sv}/\text{y}$ for the representative person and 1 $\mu\text{Gy}/\text{h}$ for wildlife, with an additional 40 $\mu\text{Gy}/\text{h}$ for the combined dose rate to habitats. IRAT2 uses Dose Per Unit Release (DPUR) factors which can be scaled using information about the disposal or discharge being assessed.

NEDO-34219 Revision A

2.4 Characteristics of the Generic Site

2.4.1 Overview

An illustrative layout of the BWRX-300 nuclear power station buildings is shown in Figure 2-1 (Reference 2-14). Further to this, an overview of the relevant systems of the BWRX-300 are comprehensively described in NEDC-34221P, “BWRX-300 UK GDA Preliminary Environmental Report E4: – Information about the Design,” (Reference 2-15).

All potential nuclear new build sites in the UK are either located by the sea or large estuaries, as described in “National Policy Statement for Nuclear Power Generation (EN-6), Volume I of II, Department of Energy and Climate Change. National Policy Statement for Nuclear Power Generation (EN-6): Volume I of II,” (Reference 2-16). The BWRX-300 generic site is coastal and assumed to be seawater abstraction for the purposes of GDA.

The BWRX-300 is capable of normal operation via “BWRX-300 Zero Release Plan,” (Reference 2-17) without the need for aqueous discharge to the environment. This is achieved using a range of abatement systems within “BWRX-300 Liquid Waste Management System,” (Reference 2-18), which are further described within PER Chapter E4 (Reference 2-15).

Three scenarios have been considered across radiological assessments presented in NEDC-34226P, (Reference 2-2). These can be briefly summarised as:

- No liquid effluent discharge, in line with the Zero Release Plan
- Maximum liquid effluent release volume of 5,968 m³/y
- Nominal annual liquid discharge, proposed as a discharge volume of 600 m³/y, representative of the second scenario (above) activities scaled by a factor of 0.101

A future developer/operator of the BWRX-300 will be responsible for decisions concerning the aqueous effluent discharge strategy and an alternative to the three scenarios described could also be considered.

The geology at the generic site is assumed to be stable with no active faults. It should be noted that the seismic activity of potential sites is assessed by the Office for Nuclear Regulation (ONR). Further consideration of geology and seismology in the context of NEDC-34164P, (Reference 2-3).

The following assumptions are also in place regarding the generic site and its proximity to water:

- The site is not located on an aquifer from which water is extracted
- There is no standing water at the site
- There are no freshwater bodies or watercourses on the site
- There are no discharges to rivers or streams on or adjacent to the site
- There is no ground or groundwater contamination present

The generic site and surrounding area are assumed to be a flat plain, with no large buildings, other than the BWRX-300 nuclear power plant, in the immediate vicinity.

Containment exhaust flow is directed to the plant vent stack via the Heating, Ventilation and Cooling System “BWRX-300 Containment Inerting System,” (Reference 2-19). The plant vent stack is situated on top of the turbine building which is the primary release point for any radioactive gaseous discharges. The height of the plant vent stack is subject to a future development stage but is expected to be 35 m above grade, “BWRX-300 General Description,” (Reference 2-20), and this value has been assumed for the Stage 2 IRAT2 calculations.

NEDO-34219 Revision A

2.4.2 Geographical Information

Assumptions relating to the geographical information used for dispersion calculations are provided in Table 2-1, these values are utilised within the IRAT2 tool, and are pre-calculated from the UK Health Security Agency PC-CREAM 08 Modelling tool (Reference 2-21).

The UK Government identified and published sites in England and Wales that are “potentially suitable” for the deployment of new nuclear power stations by the end of 2025 within its National Policy Statement (NPS) (Reference 2-16). Although a specific site for the UK BWRX-300 has not yet been selected, local compartment volumetric exchange rates of the sites identified in the NPS have been considered in subsequent calculations. These characteristics are presented in Table 2-2 and are derived from, “Initial Radiological Assessment Tool – estuary coast,” (Reference 2-22).

On 11 January 2024, the UK Government launched a nuclear siting consultation to begin the process of designating a new NPS applicable to power stations expected to deploy beyond 2025. It would be expected therefore that any future dose assessments would take into consideration this next iteration of the NPS when available.

2.4.3 Marine Data

The impact of releases of radioactivity to estuarine or coastal waters considers the impact to a generic, hypothetical fisherman family. The family are assumed to be exposed to radionuclides through shoreline sediment deposition and consumption of foodstuff incorporating radionuclides from the surrounding water. These exposures are further detailed in Section 2.4.7.

Stage 1 of the IRAT2 calculations uses conservative generic assumptions. If the first stage assessment identifies that the potential exposure to the fisherman family exceeds the screening level, then parameter values specific to the estuary or coastal water body receiving the discharge are required at Stage 2. In the model, this is referred to as the ‘local compartment’ (Reference 2-23).

The marine data relevant to the local compartment for assessments concerning an estuary or coastal water body have been included in Table 2-1, presented alongside geographical information. Detailed site specific data forms part of the site specific environmental permitting process and would therefore be considered as part of a future development stage.

2.4.4 Meteorological Data

Local meteorological data is not required for assessments carried out at Step 2 of the GDA process. Relevant meteorological characteristics that may be of consideration for radiological impact assessment are presented in NEDC-34164P (Reference 2-3). The radiological dose assessment follows the IRAT methodology assuming a uniform wind rose, together with the atmospheric conditions outlined in Table 2-3. For Stage 1 and 2 calculations, the IRAT2 methodology has assumed Category D conditions (neutral stability, typically overcast persisting for 50% of the time) that are derived from (Reference 2-13).

2.4.5 Consideration of Climate Change

Given that the UK BWRX-300 is expected to have an operational period of 60-years, “BWRX-300 Small Modular Reactor,” (Reference 2-24), erosion, weathering and exposure may impact the assumed geographical characteristics during this period. The evaluation of these characteristics, in support of the design are presented in (Reference 2-3). UK National Climate Projection 2018 data has been utilised to estimate appropriate climate change adjustment factors and their usage is described in (Reference 2-3).

2.4.6 Exposure Groups

The EA IRAT2 guidance (Reference 2-13) includes details of exposure groups that should be considered for radiological dose assessment. The BWRX-300 has been designed such that it

NEDO-34219 Revision A

can be operated under normal conditions with a zero liquid discharge. For the purposes of the GDA dose assessment in line with the scenarios presented in Section 2.4.1, it is assumed that there will be radioactive discharges to air and to coastal waters, and that there will not be any radioactive discharges to freshwater bodies nor to off-site sewage treatment plants. Therefore, only the exposure groups relevant for releases to air and coastal sites are considered.

In the case of gaseous discharge, it is assumed the exposure groups are 100 m away from the release point 100% of the time, and that food is produced 500 m from the release point. Radionuclides with a half-life of less than three hours are not considered as radioactive decay will have occurred prior to consumption.

For Stage 1 IRAT2 coastal discharge assessments, a coastal exchange rate of 30 m³/s is assumed. Within Stage 2 dose assessments, a coastal exchange rate of 634 m³/s has been selected as a suitable mid-range value based upon suitable sites identified in Table 2-2. Radionuclides with a half-life of less than three hours are not considered, all shellfish and 50% of fish are from the local compartment, and coastal wildlife is assumed to dwell in the sea immediately offshore from the point of release.

2.4.7 Human Exposure Groups

This section concerns the human exposure groups relevant to releases to air and coastal waters, a description of these groups based on the proposed discharges are described below.

Releases to air

This assumes a local resident family (one adult, one child and one infant), who are exposed via inhalation of radionuclides via:

- The effluent plume
- External radiation from radionuclides in the effluent plume deposited to the ground
- Consumption of terrestrial food incorporating radionuclides that have been deposited to the ground following gaseous discharge

Releases to coastal water

This assumes a fisherman family (one adult, one child and one infant), who are exposed to radioactive discharge via:

- External radiation from radionuclides deposited in shore sediments
- The consumption of seafood incorporating radionuclides

The habit data associated with the first exposure group, the local resident family are presented in Table 2-4 and derived from (Reference 2-13), and those for the fisherman family exposure group are presented in Table 2-5. Reference organisms are also impacted by exposure to gaseous effluent plume (through inhalation and ground deposition) and the radionuclides deposited in shore sediments. These reference organisms are described in Table 2-5.

2.4.8 Non-Human Exposure Groups

As part of the regulatory principles there is also a need to model the radiological impact to wildlife to ensure protection from permitted discharges. The terrestrial and marine environments around the generic site are assumed to act as habitats to non-humans. The default reference organisms for terrestrial and marine exposures are defined by "Environmental Risks from Ionising Contaminants: Assessment and Management (ERICA) Documentation," (Reference 2-25) and are presented in Table 2-6. The ERICA tool, "Norwegian Radiation and Nuclear Safety Authority," (Reference 2-26) supports the IRAT calculations via the DPUR.

NEDO-34219 Revision A

2.4.9 Locations of Sites of Special Scientific Interest, Areas of Outstanding Natural Beauty, and Areas of Significance to Cultural Heritage

Only the generic site characteristics needed for the GDA process have been included in this site description. The selection of sites in proximity to sites of special scientific interest, areas of outstanding natural beauty or significance to cultural heritage would form part of a future development stage and is beyond the scope of Step 2 of the GDA process.

NEDO-34219 Revision A

2.5 Conclusion

This chapter of the PER has outlined the regulatory requirement for the consideration of environmental issues in the process of site selection for a new nuclear power station. In support of these requirements, a description and bounding characteristics of the generic site have been proposed. Where appropriate, consideration of national policy concerning site characteristics has been considered.

The environmental characteristics described are intended to support the development of prospective radiological assessments within the PER Chapter E9 of the Step 2 GDA submission of the UK BWRX-300. In addition, appropriate consideration of human and non-human impacts has been made in respect of the assumed coastal siting of the BWRX-300.

Environmental factors which impact upon gaseous and liquid discharges have been described, however, the extent of liquid discharge to the environment will be subject to future decision by the operator of the BWRX-300.

The characteristics outlined in this chapter intended to specifically inform the PER chapters concerning prospective radiological impacts (E9) and other environmental regulations (E10) of the submission.
